Attention: IPEA/US

Dear Sir:

AMENDMENT UNDER ARTICLE 34

Please amend the application as follows:

Please replace pages 4, 10, 21 and 27 with the enclosed replacement pages.

On page 4, line 12, the correct SEQ. ID. NOS. have been inserted. Also on page 4, Table 1 has been corrected whereby the species are correlated with the correct SEQ. ID. NOS. These changes are supported by the original Sequence Listing supplied with the application. On page 4, line 25, "Ka-Ks" is replaced with "Ka>Ks"; on line 27, "Ka-Ks" is replaced with "Ka<Ks"; these changes are obvious and consistent within the context of the sentences containing these corrections.

Replacement page 10, lines 13-20, contain obvious corrections to the descriptions of the figures. These changes are supported by the original Sequence Listing filed with the application and the original figures.

Replacement page 21, line 29, has a correction to the SEQ. ID NOS. which is supported by the original Sequence Listing provided with the application.

Replacement page 27, lines 22-34, has insertions of SEQ. ID NOS. in claims 12 and 13. Support for these insertions is provided by the original Sequence Listing provided with the application.

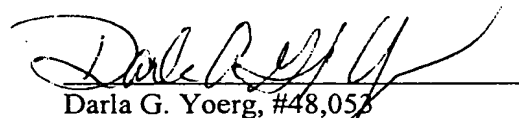

Replacement Figure 1 has SEQ. ID. NOS. inserted at the end of each polypeptide sequence. These corrections are supported by the original Sequence Listing filed with the application. Figure 1 also has an enlarged font.

Replacement Figures 2-9 have SEQ. ID. NOS. which are supported by the original Sequence Listing. They also have an enlarged font and the sequence has been divided into 10-nucleotide fragments.

It is believed that no fee is due with this submission. If this is in error, please charge any necessary fees to Deposit Account No. 19-5117.

Respectfully submitted,

Date: May 28, 2004

result of subtle differences in the TLR4 protein. Thus, information about the specific amino acid replacements that occurred during evolution could provide unparalleled insights into the mechanism by which baboons and rhesus monkeys resist LPS-induced septic shock while maintaining functional innate immunity.

5 Published *TLR4* sequences from human (GenBank AF177765, XM_057452, U88880, and U93091), bonobo (GenBank AF179220), and baboon (GenBank AF180964) were used to design primers for polymerase chain reaction (PCR) amplification of a set of *TLR4* homologs from various primates. The primate *TLR4* homologs that were amplified and sequenced included rhesus monkey, gorilla,
10 chimpanzee, gibbon, squirrel monkey, and capuchin. In addition, *TLR4* was amplified and sequenced from human, bonobo, and baboon and the published sequences for these species were confirmed (SEQ ID NOS: 1-24). As noted in Table 1, in most cases only exons 2 and 3 were sequenced (these include the full coding region of the *TLR4* gene).

15

Table 1 *TLR4* Sequences

SEQ ID NOS. 1-3	SEQ ID NOS. 4-6	SEQ ID NOS. 7-9	SEQ ID NOS. 10-12	SEQ ID NOS. 13-15	SEQ ID NOS. 16-18	SEQ ID NOS. 19-21	SEQ ID NOS. 22-24
Chimpanzee <i>Exons 2&3</i>	Gorilla <i>Exons 2&3</i>	Gibbon <i>Exons 2&3</i>	Rhesus monkey <i>Exons 2&3</i>	Capuchin <i>Exon 3</i>	Squirrel monkey <i>Exon 3</i>	Baboon <i>Exons 2&3</i>	Bonobo <i>Exons 2&3</i>

20 These sequences were aligned and a series of molecular evolution analyses were then performed. Included in these analyses were Ka/Ks pairwise comparisons for each of these genes. Such pairwise comparisons calculate the differences between values of nonsynonymous nucleotide substitutions per nonsynonymous site (Ka) to
25 synonymous substitutions per synonymous site (Ks). Ka values statistically significantly greater than the corresponding Ks values (Ka>Ks) strongly suggest the action of positive selection. Conversely, Ka values statistically significantly less than the corresponding Ks values (Ka<Ks) strongly suggest the action of negative selection,

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is an alignment of TLR4 protein sequences for the region of the protein that flanks the Asp299 residue from a number of mammalian species. Amino acid residues are shown in the single letter IUPAC code. Residues that are identical in all species examined are shown in bold. Dashes have been introduced (where insertions or deletions have occurred) to maximize the alignment. The critical residue (human Asp299, baboon Asn299) is shown in lower case. Note that this Asp residue is conserved in all mammal species examined, with the exception of the biochemically-conservative Asn replacement in the Old World monkeys baboon and rhesus (and, importantly, the non-functional human null mutant).

Figure 2 is the nucleotide sequence for baboon *TLR4* exons 2 and 3.

Figure 3 is the nucleotide sequence for bonobo *TLR4* exons 2 and 3.

Figure 4 is the nucleotide sequence for gibbon *TLR4* exons 2 and 3.

Figure 5 is the nucleotide sequence for gorilla *TLR4* exons 2 and 3.

Figure 6 is the nucleotide sequence for rhesus monkey *TLR4* exons 2 and 3.

Figure 7 is the nucleotide sequence for chimpanzee *TLR4* exons 2 and 3.

Figure 8 is the nucleotide sequence for capuchin *TLR4* exon 3.

Figure 9 is the nucleotide sequence for squirrel monkey *TLR4* exon 3.

DETAILED DESCRIPTION OF THE INVENTION

The subject invention relates to a method of identifying a nucleotide change in a TLR4 polynucleotide sequence of an Old World monkey wherein such change may be associated with reduced sensitivity to Gram-negative bacterial infection. This method involves the comparison of the TLR4 polynucleotide sequence from the Old World monkey with corresponding TLR4 polynucleotide sequence of a human to identify a polynucleotide change in said Old World monkey's TLR4 sequence that is evolutionarily meaningful. The evolutionarily meaningful change may then be associated with reduced sensitivity to Gram-negative bacterial infection. In particular, the evolutionarily meaningful change is from Asp299 in the human to Asn299 in the rhesus monkey or baboon.

The subject invention also includes a method of identifying a therapeutic agent that reduces sensitivity to Gram-negative bacterial infection. This method comprises

The amount of agent which will be effective in the treatment of a particular disorder or condition will depend on the nature of the disorder or condition, which can be determined by standard clinical techniques. In addition, *in vitro* or *in vivo* assays may optionally be employed to help identify optimal dosage ranges. The precise dose to be employed in the formulation will also depend on the route of administration, and the seriousness or advancement of the disease or condition, and should be decided according to the practitioner and each patient's circumstances. Effective doses may be extrapolated from dose-response curves derived from *in vitro* or animal model test systems. For example, an effective amount of an agent identified according to the subject methods is readily determined by administering graded doses of the agent and observing the desired effect.

The following examples are provided to further assist those of ordinary skill in the art. Such examples are intended to be illustrative and therefore should not be regarded as limiting the invention. A number of exemplary modifications and variations are described in this application and others will become apparent to those of skill in this art. Such variations are considered to fall within the scope of the invention as described and claimed herein.

Example 1. PCR amplification and DNA sequencing of primate *TLR4* sequences.

Published *TLR4* sequences from human (GenBank AF177765, XM_057452, U88880, and U93091), bonobo (GenBank AF179220), and baboon (GenBank AF180964) were used to design primers (by methods well-known to those skilled in the art) for polymerase chain reaction (PCR) amplification of a set of *TLR4* homologs from various primates. The primate *TLR4* homologs that were PCR amplified and DNA sequenced (by methods well-known to those skilled in the art) included rhesus monkey, gorilla, chimpanzee, gibbon, squirrel monkey, and capuchin. In addition, *TLR4* was amplified and sequenced from human, bonobo, and baboon and the published sequences for these species were confirmed (SEQ ID NOS: 1 to 24). Because exons 2 and 3 contain the full coding region of the *TLR4* gene, in most cases only exons 2 and 3 were sequenced. These sequences were aligned by methods well-known to those skilled in the art.

8. The method of claim 6, wherein said substantial reduction in sensitivity to Gram-negative bacterial infection is determined by an indicator selected from the group consisting of:

- (a) elimination or substantial reduction in host systemic inflammatory response to LPS in a human, non-human primate, or suitable animal model; and
- (b) elimination or reduced severity of central nervous system dysfunction, adult respiratory distress syndrome, liver failure, acute renal failure, and/or disseminated intravascular coagulation in a human, non-human primate, or suitable animal model.

10

9. A method for treating sepsis, severe sepsis or septic shock in a primate, comprising:

administering to a primate in need thereof an effective dose of a therapeutic agent identified according to the method of claim 6.

15

10. A method for treating asthma in a primate, comprising:

administering to a primate in need thereof an effective dose of a therapeutic agent identified according to the method of claim 6.

20

11. A therapeutic agent identified according to the method of claim 6.

12. A composition comprising a polynucleotide selected from the group consisting of chimpanzee *TLR4* polynucleotide (SEQ. ID. NO. 1), gorilla *TLR4* polynucleotide (SEQ. ID. NO. 4), gibbon *TLR4* polynucleotide (SEQ. ID. NO. 7), rhesus monkey *TLR4* polynucleotide (SEQ. ID. NO. 10), capuchin *TLR4* polynucleotide (SEQ. ID. NO. 13), squirrel monkey *TLR4* polynucleotide (SEQ. ID. NO. 16), and baboon *TLR4* polynucleotide (SEQ. ID. NO. 19).

25

13. A composition comprising a polypeptide selected from the group consisting of chimpanzee *TLR4* polypeptide (SEQ. ID. NO. 3), gorilla *TLR4* polypeptide (SEQ. ID. NO. 8), gibbon *TLR4* polypeptide (SEQ. ID. NO. 9), rhesus monkey *TLR4* polypeptide (SEQ. ID. NO. 12), capuchin *TLR4* polypeptide (SEQ. ID. NO. 15), squirrel monkey *TLR4* polypeptide (SEQ. ID. NO. 18), and baboon *TLR4* polypeptide (SEQ. ID. NO. 21).

ABSTRACT

The subject invention comprises a method of identifying an evolutionarily meaningful nucleotide change in a primate's *TLR4* polynucleotide. It further comprises methods for identifying agents that interact with the corresponding evolutionarily meaningful amino acid change so as to modulate the function of the TLR4 polypeptide, thereby attenuating activation of the NF-kB pathway. Such agents are useful in mitigating the LPS mediated response and in the treatment of sepsis, severe sepsis and septic shock.
